

## *CKC Breed Standard* **Norwegian Lundehund**

*January 2004*  
Standard Provided by ABIDS

**General Appearance:** The Norwegian Lundehund is a rectangular spitz dog, small, comparatively light, with distinct secondary sex characters. Strong legs with at least 6 toes on all feet, of which at least 5 toes on the forefoot and 4 on the hind foot should take part in supporting the dog. The tail is carried ring-shaped or slightly rolled over top line, or hanging. Alert, energetic and lively of temperament.

**Size:** Height: Dog: 35 - 38 cms. Bitch: 32 - 35 cms. Weight: Dog: approx. 7 kgs. Bitch: approx. 6 kgs. A dog measuring the stated maximum should not be preferred to a smaller, otherwise equally good dog.

**Origin:** Norway

**Head:** Clean, of medium width, wedge shaped. **Skull** roof slightly domed, protruding supra orbital ridges. Pronounced, but not sharp stop. Wedge shaped **muzzle** of medium length, ridge of nose slightly convex. Scissors bite preferable. A level bite and a moderate undershot bite should not be penalized. Lack of premolars on both sides in both jaws is quite common. **Eyes:** Slightly slanted eye openings, eyes not protruding, iris yellowish brown with a broader or narrower dark brown circle around the pupil of the eye. **Ears:** Triangular ears of medium size, broad at base, carried erect, very mobile. They have the specific quality that the cartilage around the ear opening is able to contract, and the external ear leather is folded and turned up in a peculiar way - backwards or at right angles upwards so that the ear opening is shut.

**Neck:** Clean cut, of medium length, rather strong with rather rich collar.

**Body:** Rectangular. Strong, straight back, rather slightly descending croup. Long chest of medium width, relatively deep and spacious, not barrel shaped. Belly slightly tucked up.

**Tail:** Set on high, medium short with dense coat but no "flag". Carried ring shaped or slightly rolled over top line, or hanging. Should not be rolled like the ones of the Norwegian Buhund or the Norwegian Elkhound. The tip of the tail should not be too much over to the side or down the flank. When, for instance, smell or sound catches attention, the tail is hanging slightly bent backwards.

**Forelegs:** Not markedly angulated. Straight under arms. Oval, slightly outward turned paws with at least 6 toes of which 5 should take part in the support of the dog. Eight pads on each paw. The inside plexus of the toe consisting of one three-joint and one two-joint toe with the corresponding tendon and muscle apparatus, gives the paw a strong appearance.

**Hindlegs:** Moderately angulated, strong with muscular upper and lower thighs. Oval, outward turned paws with at least 6 toes of which 4 take part in supporting the dog. Seven pads because the center big one and the one between toe number 0 and 1 have grown into one, the center pad thereby seeming to be prolonged backwards. When the dog is standing normally on level ground, the toe pads usually carry the weight. Position of hind legs somewhat narrow.

**Gait:** Easy and springy. Movement of front legs with a characteristic rotary action. Parallel hind movement.

**Coat:** Soft undercoat. Dense, rough outer coat. Short on head and front of the legs. Richer around the neck and the back of the thighs. Dense coat on the tail, but no "flag".

**Colour:** Reddish brown to fallow with more or less black hair tips, or black or grey, all with white markings, or white with dark markings. The full grown dog usually has got more distinct black in the outer coat than the young dog.

**Note:** Male animals should have two apparently normal testicles fully descended into the scrotum.
